Master Data Maintenance: Routing Data

Application support is ensured continuously as needed to guarantee the agreed availability of the application.

Our service

Up-to-date routing data is the basis for a smooth cooperation with courier and express services as well as with forwarders. Routing data which is not up to date may lead to longer delivery times of your packages. Therefore we offer you to enter your routing data into ASSIST4 within a maintenance window.

Your benefits

- Reliable maintenance of your routing data with expert knowledge from AEB
- Reducing workload of your shipping and/or IT department

The options

As soon as the current routing data is available and a maintenance window has been scheduled (the system will not be available during this time), the data can be imported. This may take place during or outside regular office hours. If the import takes place outside regular office hours, you can avoid the system downtime required for the maintenance of the routing data.

The requirements

Remote access to the ASSIST4 system and, if necessary, the possibility of transferring routing data to the ASSIST4 server via a remote connection.

The costs

Depending on the transport service provider (TSP) the routing data is updated every three or six months. Price per TSP and routing data update: EUR 150.
