

Generate added value through additional benefits: AEB professional services

Server Migration (Remotely or On-Site)

The IT infrastructure layer includes all hardware components, networks, operating systems and operating system-related services. This area of responsibility encompasses all hardware services of the required IT infrastructure such as design, setup, fault repair and firmware updates.

Our service

We describe a server migration as the procedure by which AEB moves software components from one server to another. E.g.: operating system upgrade from Windows 2003 to Windows 2008 server. This also affects all software components like ASSIST4, ACMS or the Compliance Engine and obviously any corresponding databases. Our support extends up to the point that we even perform all the tasks related with the migration of your Open FT software (responsible for connecting with the customs), although this software is a third-party product.

Your benefit

- Our experts perform your migration
- Migration to virtual machines is possible, thus saving resources
- Your software runs on up-to-date and supported operating systems
- We provide a technical contact person for all AEB components

The options

Decide for yourself when you want your migration to happen. A migration over the weekend is also possible if you can't stop your production during the week.

The requirements

Access via remote maintenance (e.g. via NTR) or access on-site for our staff.
